Climate change as a threat to societal stability? From violent conflicts to hot-spots of change at 1.5°C warming

**Dr. Carl-Friedrich Schleussner
(Climate Analytics)**

As the impacts of anthropogenic climate change become ever more evident and wide-spread, risks posed to societal stability and sustainable development are moving into the focus of researchers and the interested public alike.

In my colloquium talk, I want to shed some light on two aspects related to such risks: the linkage between armed conflicts and climate-related natural disasters and hot-spots of climate change at 1.5°C warming.
